

Test Report – Signup Flow Automation

Tester: Tulman Tamang

Date: June 23, 2026

Site: <https://authorized-partner.vercel.app/>

What I was asked to do

Automate the full signup process on the Authorized Partner website. No manual steps allowed — the whole thing had to run on its own from start to finish.

How I approached it

First thing I did was go through the signup flow manually in the browser just to understand what I was dealing with. I went through all four steps, filled out the forms, and paid attention to how things worked. I also had the DevTools open the whole time — Network tab to see what API calls were being made, and Elements tab to inspect the input fields and figure out the right selectors to use.

The form is split into four steps:

- Step 1 is personal info — name, email, phone number, password
- Step 2 is agency details
- Step 3 is professional experience
- Step 4 is verification and preferences including a file upload

One thing I noticed right away was that after submitting Step 1, the app sends a 6-digit OTP to the email you entered. That was clearly going to be a problem for full automation since you normally have to check your email manually. I had to figure out a way around that.

I also noticed the country and experience dropdowns weren't standard HTML selects — they were built with Radix UI which behaves differently. You have to click the trigger button, wait for the popup to open, then click the option inside it. Regular `selectOption()` wouldn't work here.

The OTP problem

This was the hardest part. The OTP is sent to a real email and the backend actually validates it, so I couldn't just type in a random number and hope for the best.

I ended up using the Gmail API to read the OTP directly from the inbox. I set up a Google Cloud project, enabled the Gmail API, created OAuth credentials, and wrote a helper function that polls the inbox every 5 seconds until the email arrives. Once it finds an email

with a 6-digit number in it, it extracts the code and fills it in automatically. In practice the email usually shows up within 15-20 seconds.

Other issues I ran into

Duplicate account errors — I kept getting "phone number already exists" errors during testing because I was using the same number every run. Fixed this by generating a random 10-digit phone number each time the test runs.

Error screen after OTP — After verifying the OTP, the app sometimes showed an "Oops! Something went wrong" page before loading Step 2. This was happening because of a server-side data fetch that was failing. I handled it by detecting that error text and pushing past it using client-side navigation so the test could continue.

Custom dropdowns — As mentioned, the Radix dropdowns needed a different approach. I had to click the combobox button, wait for the popup container to appear, then find and click the right option inside it.

Custom checkboxes — The checkboxes on Steps 3 and 4 also weren't native HTML checkboxes. They used a data-state attribute to track whether they were checked. I handled this by checking that attribute before clicking so I wouldn't accidentally uncheck something.

Code structure

I used the Page Object Model to keep things organized. Each step of the form has its own class:

- AccountPage.ts — handles Step 1 and the OTP flow
- AgencyDetailsPage.ts — handles Step 2
- ProfessionalExperiencePage.ts — handles Step 3
- VerificationPreferencesPage.ts — handles Step 4

There's also a BasePage.ts with shared helpers for things like opening Radix dropdowns and checking all visible checkboxes. The main test file just calls methods from these classes in order, which keeps it clean and easy to read.

Results

The test runs fully automatically with no manual input. It goes through all four steps, fetches the OTP from Gmail on its own, fills everything in, and submits the form. At the end it takes a screenshot.

Step	Result
Load page and accept terms	Pass

Step	Result
Fill personal details	Pass
Receive and enter OTP automatically	Pass
Fill agency details	Pass
Fill professional experience	Pass
Fill verification and upload file	Pass
Submit form	Pass

All steps passed.

Test data

Field	Value
Email	tulmantamang9@gmail.com
Phone	Random 10-digit number each run
Password	Reliance@123
Agency	Tulman Agency
Country	Nepal
Preferred Country	Australia
Business Reg No	TU-12345
File	sample.pdf

Setup used

- Windows 11
- Node.js v18
- Playwright v1.40
- TypeScript v5
- Chromium browser
- Gmail API for OTP
